                          The present sequence encodes a human RECAP (receptors and associated CC proteins) polypeptide. RECAP polypucleotides and polypeptides are useful in the diagnosis, treatment and prevention of neurological disorders such as stroke, Alzheimer's disease, Pick's disease, Huntington's CC disease, dementia, Parkinson's disease, Downs's syndrome, amyotrophic lateral sclerosis, multiple sclerosis, bacterial and viral meningitis, CC disease, Discoural and viral meningitis, CC disease, Immunological disorders, including autoimmune/inflammatory CC disorders such as AIDS, DiGeorge's syndrome, severe combined CC disorders such as AIDS, DiGeorge's syndrome, severe combined CC disease, Addison's disease (SCID), Chediak-Higashi syndrome, Cushing's CC disease, Addison's disease, autoimmune thyroiditis, Crohn's diseases, CC disease, Thyroiditis, Sjogren's syndrome, Yenre's diseases, CC disease, Thyroiditis, Sjogren's syndrome, Werner's syndrome, viral, Bacterial, fungal, parasitic, protozoal, and helminthic infections; and cell proliferation disorders such as arteriosclerosis, atherosclerosis, cirrhosis, hepatitis and cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                21-JUL-1999;

The invention relates to isolated polynucleotide (I) and CC polymerase (II) sequences. (I) is useful as hybridisation probes, CC polymerase chain reaction (PCR) primers, oligomers, and for chromosome CC and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags CC for identifying expressed genes. (I) is useful in gene therapy techniques CC (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as CC a food supplement. (II) and its binding partners are useful in medical CC imaging of sites expressing (II). (I) and (II) are useful for treating CC disorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in CC diagnostics, forensics, gene mapping, identification of mutations CC responsible for genetic disorders or other traits to assess blodiversity and to produce other types of data and products dependent on DNA and CC amino acid sequences and for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO of the polypeptide in the sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO of the polypeptide and polypeptide in electronic format directly from WIPO of the polypeptide and polypeptide in electronic format directly from WIPO of the polypeptide and polypeptide in electronic format directly from WIPO of the polypeptide and polypeptide in electronic format directly from WIPO of the polypeptide and polypeptide in electronic format directly from WIPO of the polypeptide and polypeptide in electronic format directly from WIPO of the polypeptide and polypeptide in electronic format directly from WIPO of the polypeptide and polypeptide in electronic format directly from WIPO of the polypeptide and polypeptide in electronic format directly from WIPO of 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New isolated polynucleotide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits and to assess

                                                        This is full-length CR1 protein, and shortened forms are new, lacking the transmembrane region. The proteins and fragments bind C3b and/or C4b, have cofactor activity and inhibit C3 and C5 convertes activity. They are useful in diagnosing and treating immune disorders, and preventing are useful in diagnosing and treating immune disorders, and preventing are useful.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       This sequence is a composite of sequences isolated as lambda clones H10.3, T109.1, H3.1 and H7.1. The clones were present in the specifically primed lambda 9tl1 cDNA library (Lambda HH) which was prepared with cDNA synthesised from poly(A)+ RNA from DMSO induced H1.-60 cells. The library was screened using probes CR1-1, CR-2 and CR1-4 (see Mong, WW et al., 1985, Proc. Nat. Acad. Sci. USA. 82:7711) and probe CR1-18 (corresponding to nucleotides 101-352 of this sequence). There are four direct, long homologous repeats of 450bp, each comprising 7 short consensus repeats. Nucleotides 28-1533 are also claimed separately.

                             -length human CR1 as expressed on erythrocytes. The CR1 function in vivo may be mediated through the inhibition of complement pathway enzymes. The soluble CR1 protein exhibits a complement regulatory activity, and this may be used to prevent reperfusion injury, inhibit Arthus reaction, and neutrophil mediated tissue damage, and reduce myocardial infarct size, and inflammation. The CR1 protein and its fragments can also be used in the treatment of conditions which involve unwanted complement activity, e.g. shock lung, tissue damage due to burn, or ischemic heart conditions, and autoimmune disorders. CR1 proteins, analogues, derivatives, and anti-CR1 antibodies are used in assays, and diagnostics. The present sequence represents a DNA encoding the human CR1 protein.
                                                                                                                                                                                                                                     The invention relates to a human C3B/C4B receptor (CR1) protein. The CR1 protein on fragment is expressed as a cell-surface protein on the surface of a non-human cell and exhibits a complement regulatory activity of full-length human CR1 as expressed on erythrocytes. The CR1 function in vivo

                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to human nucleic acids (AAI57798-AAI61369) and the encoded polypeptides (AAM38642-AAM42213) with nootropic, immunosuppressant and cytostatic activity. The polypucleotides are useful in gene therapy. A composition containing a polypeptide or polynucleotide of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous injuries, peripheral nervopathy and localised neuropathies and central nervous system diseases, such as Alzhelmer's, Parkinson's disease, Huntington's disease, amyotrophic lateral sclerosis, and Shy-Drager Syndrome. Other uses include the utilisation of the activities such as: Immune system suppression, activiny, inhibin activity, chemotactic/chemokinetic activity, haemostatic and thrombolytic activity, chemotactic/chemokinetic activity, haemostatic assays for receptor activity, arthritis and inflammation, leukaemias and C.N.S disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Claim 1; SEQ ID NO 583; 10078pp; English.

Sequences ABB10981-ABB12330 represent 1350 novel human polypeptides, and sequences ABA08225-ABA09574 represent nucleic acids encoding them. The invention also relates to vectors and recombinant host cells comprising a nucleotide of the invention, methods of producing the novel polypeptides, antibodies against the polypeptides, methods of detecting the nucleotides or polypeptides in a sample, and methods of identifying compounds which bind to polypeptides of the invention have homology to known proteins, thereby
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             haematopolesis regulation; tissue growth; immunomodulator; activin; inhibit; chemotaxis; chemokinesis; thrombolysis; oncogenesis; proliferation; metastasis; cancer; tumour; haematopoletic disorder; myeloid cell disorder; lymphoid cell disorder; asthma; arthritis; chronic inflammatory condition; proliferative retinopathy; atherosclerosis; coronary heart disease; arterial ischaemia; bone disorder; osteoporosis; vascular growth disorder; tissue regeneration; wound healing; infection; immune disorder; cell culture; drug screening; gene therapy; antiaflammatory; antiasthmatic; antiarthritic; haemostatic; antiarteriosclerotic; cytostatic; osteopathic; vasotropic; cardiant; virucide; antibacterial; antifungal; vulnerary; antiulcer; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  haematopoiesis requiatory activity; tissue growth activity; conditions requiatory activity; tissue growth activity; conditions, activity; activities; haemastatic, thrombotic or chemokinetic activities; haemastatic, thrombotic or thrombolytic activities; receptor or ligand activities; or may be involved in oncogenesis, cancer cell proliferation or metastasis. Depending on their biological activities, polypeptides and nucleotides of the invention are useful for preventing, treating or ameliorating medical conditions, e.g., by protein or gene therapy. Such conditions include cancers, haematopoietic disorders (e.g., myeloid or lymphoid cell disorders, chronic inflammatory conditions (e.g., asthma or arthritis), coronary heart disease, and abnormal conditions, and abnormal conditions include activities, bone disorders (e.g., osteoporosis), and abnormal constitution of uncleic acids encoding them may be used to promote wound conditions to municondulatory activities may be used in the treatment of viral, bacterial and fungal infections in addition to immune disorders. Polypeptides with growth factor activity may be used in cell cultures to promote cell growth. For example, such polypeptides may be used to promote cell growth. For example, such polypeptides may be used to complete stem cells in culture to give rise to neuroepithelial cells can be used to autoimmune disease or accidental damage. The polypeptides and nucleotides may also be used to the diagnosis of the above conditions, and in drug screening techniques. The present sequence represents a cDNA encoding a novel human polypeptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Percent Similarity:

                                                                                                                                               The invention relates to human nucleic acids (AAI57798-AAI61369) and the encoded polypeptides (AAM38642-AAM42213) with nootropic, immunosuppressant and cytostatic activity. The polypucleotides are useful in gene therapy. A composition containing a polypeptide or polynucleotide of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous injuries, peripheral neuropathy and localised neuropathies and central nervous system diseases, such as a localised neuropathies and central nervous system diseases, such as Alzheimer's, Parkinson's disease, Huntington's disease, amyotrophic lateral sclerosis, and Shy-Drager Syndrome. Other uses include the utilisation of the activities such as: Immune system suppression, ActivinyInhibin activity, chemotactic/chemokinetic activity, haemostatic and thrombolytic activity, chemotactic/chemokinetic activity, days creening, and thrombolytic activity, cancer diagnosis and therapy, drug screening, and the contractivity and concerdiagnosis and therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human; nootropic; immunosuppressant; cytostatic; gene therapy; cancer; peripheral nervous system; neuropathy; central nervous system; CNS; peripheral nervous system; neuropathy; central nervous system; CNS; Alzheimer's; parkinson's disease; haemostatic; amyotrophic lateral sclerosis; Shy-Drager Syndrome; chemotactic; amyotrophic lateral sclerosis;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Tang YT,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      21-JAN-2000;

CM7 DNA was constructed using plasmid pDB1013-5, which CC codes for SCR1-3 of CR1, by site-directed mutagenesis using 3 pairs CC of oligonucleotides (see AAV3263-65) that introduced 10 amino acid CC changes to the native SCR3 sequence corresponding to changes CC observed in the CR1-like pseudogene (Cr1pse). pBrocSCR1-3CM7 CC carrying the CM7 DNA construct was used to transform Escherichia CC carrying the CM7 DNA construct was used to transform Escherichia CC CAAV3269-79) encoding novel soluble engineered CR1 pD1ypeptides (see CAAV3269-79) encoding novel soluble engineered CR1 pD1ypeptides (see CAAV3269-79) encoding novel soluble engineered CR1 pD1ypeptides (see CAAV3269-79) pencoding novel soluble engineered CR1 pD1ypeptides (see CAAV3269-79) encoding novel soluble engineered CR1 pD1ypeptides (see CAAV3269-79) encoding novel soluble engineered CR1 pD1ypeptides (see CAAV3329-47) such as CM7 that act as complement inhibitors with CC cartivity. These can be used to treat a disease or disorder CC activity. These can be used to treat a disease or disorder CC activity disorders (e.g. multiple sclerosis and CC arkhrinson's disease), disorders (e.g. multiple sclerosis and CC complement activation (e.g. xenograft rejection), inflammatory CC disorders (e.g. Crohn's disease, asthma, and acute pancreatitis), CC post-ischaemic reperfusion conditions, infection or sepsis, the complement complex disorders and autoimmune diseases (e.g. rhematoid CC arthritis, proliferative nephritis and myasthenia gravis), and cCC reproductive disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     US-10-031-904-8 x AAV53262

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             seq_name: /SIDS1/gcgdata/geneseq/geneseqn-embl/NA1998.DAT:AAV53269
        This DNA sequence encodes CM1 (see AAW79237), a protein that consists CC of the short consensus repeats (SCR) 1 and 2 from complement CC receptor type 1 (CR1) fused to an SCR3 (see AAW79242) in which 5 amino CC acids were altered to those found in the SCR3 of the CR1-like pseudogene (Cripse) putative product. CM1 DNA was constructed by CC site-directed mutagenesis (see AAW53263) of plasmid pbBJD13-5. which codes for SCR1-3 of CR1. pBrocSCR1-30M1 carrying CM1 DNA was used CC totransform Escherichia coll BL2(DE3), and CM1 was purified from CC solubilised inclusion bodies. The invention provides DNA sequences (see AAW53262 and AAV53269-79) encoding novel soluble engineered CR1 collubilised inclusion bodies. The invention provides DNA sequences (see AAW53252 and AAV53269-79) encoding novel soluble engineered CR1 collubilised inclusions at the second complement inhibitory, including anti-haemolytic, activity. These can be used to treat a disease or construction, such as neurological disorders (e.g. multiple sclerosis activation, such as neurological disorders (e.g. multiple sclerosis complement activation (e.g. venouraft rejection). Inflammation or complement activation (e.g. venouraft rejection).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Complement receptor type-1; CR1; CM1; complement; inhibitor; anti-haemolytic; multiple sclerosis; Parkinson's disease; xenograft rejection; inflammation; Crohn's disease; asthma; pancreatitis; post-ischaemic reperfusion; infection; sepsis; autoimmune disease; rheumatoid arthritis; proliferative nephritis; myasthenia gravis; reproductive disorder; therapy; ss.

co fithe short consensus repeats (SCR) 1 and 2 from complement creceptor type 1 (CRI) fused to an SCR3 (see AAW79243) in which 4 amino codes were altered to those found in the SCR3 of the CRI-like pseudogene (Cripse) putative product. CMZ DNA was constructed by steredirected mutagenesis (see AAW53264) of plasmid pDB1013-5, which Cc codes for SCR1-3 of CR1. pBrocSCR1-3CM2 carrying CM2 DNA was used ct otransform Escherichia coli BLA1(DB3), and CM2 was putified from CC solubilised inclusion bodies. The invention provides DNA sequences (see AAW53262-79) encoding novel soluble engineered CR1 CC polypeptides (see AAW53269-79) encoding novel soluble engineered CR1 CC inhibitors with functional complement inhibitory, including cantivation, such as neurological disorders (e.g. multiple sclerosis and latvation, such as neurological disorders (e.g. multiple sclerosis complement activation, such as neurological disorders (e.g. multiple sclerosis and parkinson's disease), disorders of inappropriate or undesirable CC complement activation (e.g. xenograft rejection), inflammatory clischaemic reperfusion conditions, infection or sepsis, immune complex disorders and autolumnune diseases (e.g. rheumatoid cr reproductive disorders and autolumnune diseases (e.g. rheumatoid cr reproductive disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Soluble polypeptide comprising short consensus repeats from LHR-A used to treat disorders and diseases associated with inflammation inappropriate complement activation

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          seq_name:
            This DNA sequence encodes CM2 (see AAW79239), a protein that consists of the short consensus repeats (SCR) and 2 from complement receptor type 1 (CR1) fused to an SCR3 (see AAW79244) in which 1 amino acid was altered to that found in the SCR3 of the CR1-like pseudogene (Cr1pse) putative product. CM3 DNA was constructed by seudogene (Cr1pse) putative product and the SCR3 of plasmid pDB1013-5, which codes for SCR1-3 of CR1. pBrocSCR1-3CM3 carrying CM3 DNA was used to transform Escherichia coli BLZ1(DE3), and CM3 was putified from solubilised inclusion bodies. The invention provides DNA sequences (see AAW33262 and AAW33269-79) encoding novel soluble engineered CR1 (see AAW33262 and AAW33269-79) encoding novel soluble engineered CR1 inhibitors with functional complement inhibitory, including anti-haemolytic, activity. These can be used to treat a disease or disorder associated with inflammation or inappropriate complement and various and beautions, such as neurological disorders (e.g. unlipse solerosis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Complement receptor type-1; CR1; CM3; complement; inhibitor; anti-haemolytic; multiple sclerosis; Parkinson's disease; xenograft rejection; inflammation; Crohm's disease; astima; pancreatitis; post-ischaemic reperfusion; infection; sepsis; autoimmune disease; rheumatoid arthritis; proliferative nephritis; myasthenia gravis; reproductive disorder; therapy; ss.

This DNA sequence encodes CM6 (see AAW79241), a protein that consists of the short consensus repeats (SCR) 1 and 2 from complement receptor type 1 (CR1) fused to an SCR3 (see AAW79246) in which 6 amino acids were altered to those found in the SCR3 of the CR1-like pseudogene (Cr1pse) putative product. CM6 DNA was constructed by stie-directed mutagenesis (see AAW32363 and AAW32365) of pDB1013-5, which codes for SCR1-3 of CR1. pBrocSCR1-3CM6 carrying CM6 DNA was used to transform Escherichia coll BL21(DE3), and CM6 was purified from Sclubilised inclusion bodies. The invention provides DNA sequences (see AAW53262 and AAW53269-79) encoding novel soluble engineered CR1 collypoptides (see AAW53269-74) such as CM6 that act as complement inhibitors with functional complement inhibitory, including anti-haemolytic, activity. These can be used to treat a disease or disorder associated with inflammation or inappropriate complement consociated with inflammation or inappropriate complement
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Complement receptor type-1; CR1; CM6; complement; inhibitor; anti-lamentyltic; multiple sclerosis; parkinson's disease; xenograft rejection; inflammation; Crohn's disease; asthma; pancreatitis; post-ischaemic reperfusion; infection; sepsis; autoimmune disease; rheumatoid arthitis; proliferative nephritis; myasthenia gravis; reproductive disorder; therapy; ss.

CC molecular weight as membrane-associated CRI. SCRI binds C3b and C4b CRI that have covalently attached to immune complexes and other complement CC activators. The consequences of these interactions depends on the CC type of bearing the receptor. Erythrocyte CRI binds immune complexes if or transport to the liver. CRI on neutrophils and monocytes internalises bound complexes, either by adsorptive endocytosis. CC or by phagocytotsis. The function of CRI on B lymphocytes is less CC well defined. CRI can inhibit the classical and alternative pathway CC C3/C5 convertases and act as a cofactor for the cleavage of C3b and C4b by factor I, therefore CRI has a complement regulatory function CRI as well as acting as a receptor. CRI is a glycoprotein composed of CC a single polypeptide chain. Four allotypic forms of CRI have been CC identified, differing by increments of approx. 40-50 kD. The two most CC may molecular weights of 250 and 290 kD respectively. The two rarer CC forms have molecular weights of 250 and 290 kD. These differences CC glycosylation state because they are not abolished by treatment of CRI prified receptor portein with endoglycosidase F. The CRI gene has CC been shown to have repetitive intervening sequences which may have conducted in the formation of the larger allotypes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   PEXXX
                                                                                                                                                                                                                                                                                                                                                                                                                                   This sequence represents the entire coding region for the C3b/C4b receptor (CR1). CR1 is present on erythrocytes, monocytes/macro-phages, granulocytes, B cells, some T cells, splenic follicular dendritic cells and glomerular podocytes. CR1 specifically binds C3b, C4b and inactivated C3b (1C3b). A soluble form of the receptor is found in plasma which has ligand binding activity and the same molecular weight as membrane-associated CR1. CR1 binds C3b and C4b
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Claim 1; Fig 1; 90pp; English.

Identification of an alternative polyadenylation site in the human
C3b/C4b receptor (complement receptor type 1) transcriptional unit
and prediction of a secreted form of complement receptor type 1

Following HAP purification, this DNA was used as tracer in a subtractive hybridization reaction. The driver was PCR-amplified cDNAs from a pool of 5,000 clones made from the same library (cloneIDs 1322376-132391, 1456007-1456775, and 1500552-1502855). Subtraction by Bento Soares and M. Fatima Bonaldo. "39 t
